

AIM

To examine the concept of low-code application development, study the transition from conventional coding-based development to visual and configuration-driven development, identify the major benefits and limitations of low-code platforms, and compare commonly used low-code application development platforms.

TRADITIONAL APPLICATION DEVELOPMENT VS EMERGING TRENDS IN LOW-CODE APPLICATION DEVELOPMENT

Aspect	Traditional Application Development	Emerging Low-Code Application Development
Development Method	Applications are developed mainly by writing and testing source code.	Applications are created largely through visual builders, configuration, and reusable components.
Development Speed	Design, coding, debugging, and testing generally require more development time.	Visual components and ready-made modules can shorten the development cycle.
Coding Requirement	Requires considerable programming knowledge and technical expertise.	Reduces the amount of coding required and can also support users with limited programming experience.
Application Design	Developers have direct control over the application architecture and implementation.	Application structure is created using drag-and-drop elements, forms, workflows, and configuration options.

Aspect	Traditional Application Development	Emerging Low-Code Application Development
Customization	Source-code access provides a high degree of control over application behavior.	Customization is mainly based on platform capabilities, with coding used where additional flexibility is required.
Tools and Resources	Typically involves programming languages, frameworks, databases, IDEs, and development environments.	Commonly uses visual builders, templates, pre-built components, integrations, and workflow tools.
Maintenance	Modifications frequently involve changing, testing, and redeploying source code.	Many changes can be performed through configuration and platform-level settings.
Current Development Trend	Modern development increasingly uses frameworks, cloud services, and automation.	Low-code/no-code adoption is growing along with workflow automation, reusable components, and rapid application creation.

BENEFITS AND CHALLENGES IN LOW-CODE APPLICATION DEVELOPMENT

Benefits	Challenges
Visual development can significantly reduce the effort required for application creation.	Platform features may restrict customization for highly specialized requirements.
Reusable components help reduce repetitive development work.	The application becomes dependent on the capabilities and limitations of the selected platform.

Benefits	Challenges
Applications can be prototyped and modified quickly.	Integration with external systems may become difficult in certain situations.
Business users and citizen developers can participate in application development.	Security, privacy, and user-access configurations must be configured correctly.
Forms, reports, workflows, and integrations are often available as built-in features.	Highly complex applications may still require conventional programming.
Faster development can support quicker delivery of business-oriented solutions.	Users must understand platform governance, maintenance requirements, and limitations.

OBSERVATION

Low-code development mainly changes how an application is constructed rather than eliminating the need for software-development principles. The major difference is that many implementation tasks are performed through visual components and configuration instead of being written entirely from scratch. This makes low-code particularly suitable for forms, workflows, reports, and other structured business applications.

COMPARISON OF EXISTING LOW-CODE PLATFORMS

Platform	Major Capabilities	Common Application Area
Zoho Creator	Visual application builder with forms, reports, workflows, and integrations.	Business applications, form-based systems, process automation, and database-oriented applications.

Platform	Major Capabilities	Common Application Area
Microsoft Power Apps	Low-code application creation with connectors, workflows, and integration with Microsoft services.	Internal business applications and organizational solutions.
OutSystems	Visual development environment with lifecycle management and integration capabilities.	Enterprise applications and larger digital solutions.
Mendix	Visual modeling, reusable components, workflows, and collaborative development features.	Enterprise application development and business process automation.
AppSheet	No-code/low-code application creation with data-driven functionality and automation.	Simple business applications, data collection, and workflow-based solutions.

PROCEDURE

1. Study the concept and purpose of low-code application development using Zoho Creator.
2. Identify the basic fields required for the Insurance Claim Request Form and understand their purpose in collecting claimant, policy, contact, and claim details.
3. Create the Insurance Claim Request Form in Zoho Creator using the required basic fields such as Name, Email, Address, Phone, Single Line, Multi Line, Number, Date, Time, Drop Down, Radio, Multi Select, and Checkbox.
4. Organize the form into appropriate sections for Claimant Details, Contact Details, Claim Details, and Scheduling and Declaration, and configure the required validation rules for the fields.
5. Preview and test the form by entering sample insurance claim details, submitting the form, and verifying that the submitted data is stored correctly in the claim request report.
6. Generate the Claim_Request_Report and record sample submitted claim requests for verification and further processing.

RESULT

Thus, the principles of low-code application development were studied and the transition from conventional coding-based development to visual and configuration-driven development was examined. The major benefits and challenges of low-code platforms were analyzed, and commonly used low-code platforms were compared based on their capabilities and application areas.

The assigned Insurance Claim Request & Processing Management application was also studied as a practical example of low-code development in Zoho Creator, including its form structure, field usage, validation requirements, and report-based workflow.
